

5 REASONS WHY A DENTAL IMPLANT CAN SAVE YOUR TEETH

Adults age **20 to 64** have an average of **24.92** remaining teeth. Missing a tooth?

You might be inclined to forget about it or to postpone getting it treated, but every day you are postponing treatment will lead to more dental problems in the future.

ARE DENTAL IMPLANTS RELIABLE?

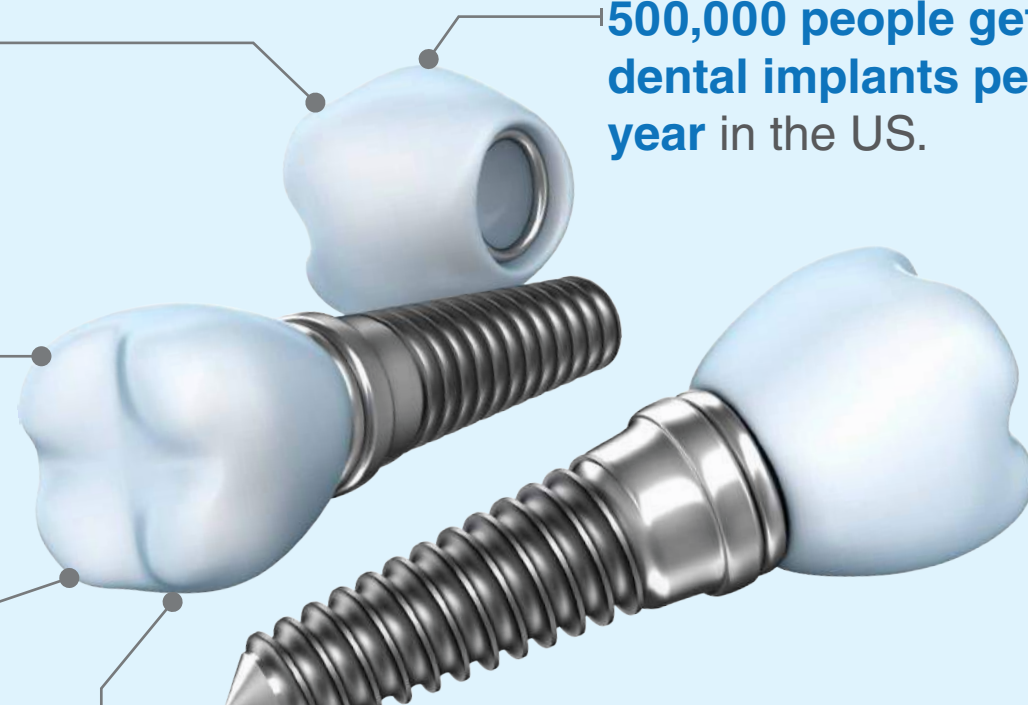

It is estimated that roughly **3 million people** have tooth implants in the US alone.

500,000 people get dental implants per year in the US.

Dental implant **success rates are 95%** or higher over 10 years.

Dental implants provide **the feel, function and appearance of natural teeth.**

Implants involve **minimally-invasive techniques** and have a success rate higher than any other tooth replacement system.

WHAT HAPPENS IF YOU DO NOT OPT FOR A DENTAL IMPLANT

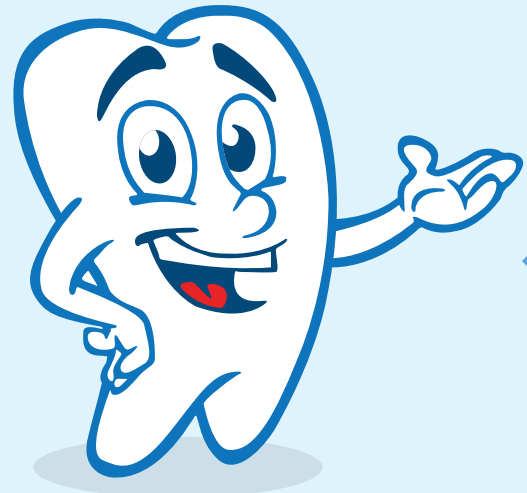

1 At least 1 neighboring tooth will migrate & recline towards the empty space. Soon, teeth in abnormal positions will deform and even break.

2 Periodontal disease is **50%** more likely and may be the cause for a new extraction.

3 The teeth near the gap will develop caries **7 times faster**. Because they move and their root is exposed.

4 Because you are missing a tooth on one side of the mouth you will **put other teeth under more pressure & they will break faster.**

5 Other solutions will affect the structure of surrounding teeth, need constant care and do not replicate natural teeth correctly.

Do you want to have healthy and beautiful teeth? Do you want to be able to chew and taste food fully?

Wish to eliminate pain, protect natural teeth and to have a nice smile?
